Insights:
I have learned that XAMPP is a simple Apache distribution which helps us students in creating local web servers for us to test and experiment unto. We have learned how to install it on our devices such as computers and laptops as the set up and installation is tutored and showed clearly. On another note, I have identified how to create a database within the phpMyAdmin, or the admin of MySQL and locate it within my device. It is also important to maintain convention in naming my intended databases for us to have minimal difficulties in locating the said databases.
